enviolyprotein - feline leukemia virus (strain lambda-B1) (fragment)
N;Contains: coat protein gp70; coat protein p15E
N;Contains: coat protein gp70; coat protein p15E
C;Species: feline leukemia virus
C;Species: 31-Mar-1989 #sequence_revision 31-Mar-1989 #text_change 09-Jul-2004
C;Accession: A27172
R;Nicolaisen-Strouss, K.; Kumar, H.P.M.; Fitting, T.; Grant, C.K.; Elder, J.H.
J. Virol. 61, 3410-3415, 1987
A;Title: Natural feline leukemia virus variant escapes neutralization by a monoclonal ant.
A;Reference number: A27172; MUID:88036192; FMID:2444714
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             C;Superfamily: type C retrovirus env polyprotein

env polyprotein precursor - HoMuLV murine leukemia virus

Ny Contains: knob protein gp76; spike protein p15E

C; Species: HoMuLV murine leukemia virus

A;Note: host Mus hortulanus (European mouse)

C; Date: 3.1-Dec-1990 #sequence_revision 31-Dec-1990 #text_change 09-Jul-2004

C; Accession: B32594

R; Voytek, P; Kozak, C.A.

Virology 173, 58-67, 1989

A;Title: Nucleotide sequence and mode of transmission of the wild mouse ecotropic virus,

A;Reference number: A32594; MUID:90051094; PMID:2554579

A;Accession: B32594
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          14;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     SROSOTKSKVTTQRPQIT--SSTPRSVASATMGP--KRIGTGDRLINLVQGTYLALNATD 302

                                                                                                                                    FUNCTION: SU mediates receptor recognition (By similarity).

FUNCTION: TW anchors the envelope heterodimer to the viral membrane through one transmembrane domain. The other transmembrane domain, called fusion peptide, mediates fusion of the viral membrane with the target cell membrane (By similarity).

SUBUNIT: The surface (SU) and transmembrane (TM) proteins form a heterodimer. SU and TM are attached by noncovalent interactions or by a labile interchain disulfide bond (By similarity).

DOMAIN: The CKS-17 immunosuppressive domain is present in many retroviral envelope proteins. As a synthetic peptide, it inhibits immune function in vitro and in vitvo (By similarity).

PTM: Specific enzymatic cleavages in vivo yield the mature SU and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         TW proteins (By similarity).

PTM: The CXXC motif is highly conserved across a broad range of retroviral envelope proteins. It is thought to participate to the formation of a labile disulfied bond possibly with the CX6CC motif present in the transmembrane protein (By similarity).

MISCELLANEOUS: Ortholog of the human HERV-W_7q21.1 envelope

-i FUNCTION: 50 mediates receptor recognition (By similarity).
-i FUNCTION: TW anchors the envelope heterodimer to the viral membrane through one transmembrane domain. The other transmembrane domain, called fusion peptide, mediates fusion of the viral membrane with the target cell membrane (By similarity).
-i SUBUNIT: The surface (SU) and transmembrane (TW) proteins form a heterodimer. SU and TM are attached by noncovalent interactions or by a labile interchain disulfide bond (By similarity).
-i-DOMAIN: The CKS-17 immunosuppressive domain is present in many retroviral envelope proteins. As a synthetic peptide, it inhibits immune function in vitro and in vivo (By similarity).
-i-FTW: Specific enzymatic cleavages in vivo yield the mature SU and TW proteins (By similarity).
-i-FTW: Specific enzymatic cleavages in vivo yield the mature SU and TW proteins (By similarity).
-i-FTW: The CXXC motif is highly conserved across a broad range of retroviral envelope proteins. It is thought to participate to the formation of a labile disulfide bond possibly with the CX6CC motif present in the transmembrane protein (By similarity).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 This SWISS-PROT entry is copyright. Mallet F., Bouton O., Prudhomme S., Cheynet V., Oriol G., Bonnaud B., Lucotte G., Duret L., Mandrand B., Elucotte G., Duret L., Mandrand B., The endogenous retroviral locus ERVWEI is a bona fide gene involved in hominoid placental physiology.";
Proc. Natl. Acad. Sci. U.S.A. 101:1731-1736(2004).

-I. FUNCTION: Retroviral envelope proteins mediate receptor recognition and membrane fusion during early infection. Endogenous envelope proteins may have kept, lost or modified their original function during evolution. This endogenous envelope protein has retained its original fusogenic properties. In vitro it fuses
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               cells expressing the type D mammalian retrovirus receptors SLC1A4

"The endogenous retroviral locus ERVWEI is a bona fide gene involved in hominoid placental physiology.";
Proc. Natl. Acad. Sci. U.S.A. 101:1731-1736 (2004).

-!-FUNCTION: Retroviral envelope proteins mediate receptor recognition and membrane fusion during early infection. Endogenous envelope proteins may have kept, lost or modified their original function during evolution. This endogenous envelope protein has retained its original fusogenic properties. It can make

FUNCTION: TM anchors the envelope heterodimer to the viral membrane through one transmembrane domain. The other transmembrane domain, called fusion peptide, mediates fusion of the viral membrane with the target cell membrane (By similarity).
SUBDNIT: The surface (SU) and transmembrane (TM) proteins form a heterodimer. SU and TM are attached by noncovalent interactions or by a labile interchain disulfide bond (By similarity).
DOMAIN: The CKS-17 immunosuppressive domain is present in many retroviral envelope proteins. As a synthetic peptide, it inhibits immune function in vitro and in vivo (By similarity).
FTM: Specific enzymatic cleavages in vivo yield the mature SU and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   TM proteins (By similarity).

PTM: The CXXC motif is highly conserved across a broad range of retroviral envelope proteins. It is thought to participate to the formation of a labile disulfide bond possibly with the CX6CC motif present in the transmembrane protein (By similarity).

MISCELLANBOUS: Ortholog of the human HERV-W_7Q21.1 envelope

RESULT

```
-!- FUNCTION: SU mediates receptor recognition (By similarity).
-!- FUNCTION: TM anchors the envelope heterodimer to the viral membrane through one transmembrane domain. The other transmembrane domain, called fusion peptide, mediates fusion of the viral membrane with the target cell membrane (By similarity).
-!- SUBMNIT: The surface (SU) and transmembrane (TW) proteins form a heterodimer. SU and TM are attached by noncovalent interactions or by a labile interchain disulfide bond (By similarity).
-!- DOMAIN: The CKS-17 immunosuppressive domain is present in many retroviral envelope proteins. As a synthetic peptide, it inhibits immune function in vitro and in vivo (By similarity).
-!- PTM: Specific enzymatic cleavages in vivo yield the mature SU and TM proteins (By similarity).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    This SWISS-PROT entry is copyright. "The endogenous retroviral locus ERVWEL is a bona fide gene involved in hominoid placental physiology.";

Proc. Natl. Acad. Sci. U.S.A. 101:1731-1736(2004).

-! FUNCTION: Retroviral envelope proteins mediate receptor recognition and membrane fusion during early infection. Endogenous envelope proteins may have kept, lost or modified their original function during evolution. This endogenous envelope protein has retained its original fusogenic properties. In vitro it fuses cells expressing the type D mammalian retrovirus receptors SLC1A4 and SLC1A5.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            PTM: The CXXC motif is highly conserved across a broad range of retroviral envelope proteins. It is thought to participate to the formation of a labile disulfide bond possibly with the CX6CC motif present in the transmembrane protein (By similarity).
